ACKNOWLEDGEMENTS

An endeavor of a long period can be successful only with the advice of many well-wishers. I take this opportunity to express my deep gratitude and appreciation to all those who encouraged for successfully completion of the community service project work.

We are thankful to my Guide **Mrs.V.LAKSHMI CHAITANYA**, Assistant Professor in Department of CSE, SREC, Nandyal, for her valuable guidance and suggestions in analyzing and testing throughout the period, till the end of community service project completion.

We deeply express my heartily gratitude and thanks to the Coordinator **MR.SUBBA RAO** for his valuable guidance, enriching thoughts and profound knowledge, which brought my Community service project to its completion.

Our special thanks to **Dr.S.Md.FAROOQ**, Head of Computer Science and Engineering Department, SREC, and Nandyal. During the progress of Community service project for him timely suggestions and helped me inspite of him busy schedule.

We wish to convey my gratitude and express sincere thanks to all **P.R.C** (Project Review Committee) members for their support and Co-operation rendered for successful submission of my community service project.

We wish to express my sincere gratitude to Sri **Dr.M.V. SUBRAMANYAM** Garu, Principal of SREC, Nandyal for his consistent help and encouragement to complete the community service project.

Finally, we would like to express our sincere thanks to faculty members of C.S.E. Department- Data Science, Parents and lab technicians, one and all who have helped to complete the community service project work successfully.

By

VISION OF THE INSTITUTE:

To become a nucleus for pursuing technical education and pool industrial research and developmental activities with social-conscious and global standards.

MISSION OF THE INSTITUTE:

1. To provide Advanced Educational Programs and prepare students to achieve success and take leading roles in their chosen fields of specialization by a rising a self-sustained University.
2. To establish postgraduate programs in the current and Advanced Technologies.
3. To establish an R&D Consultancy through developing Industry Institute Interaction, building up exceptional infrastructure.
4. To proper every individual, realize and act for the technical development of the society.

INSTITUTE QUALITY POLICY:

1. We at SANTHIRAM ENGINEERING COLLEGE are committed to promote and stimulate quality and continuous improvement of standards to empower the students with cutting- edge technologies to meet the ever-changing challenges of humanity by performance analysis, counselling the students and evaluation of feedback.
2. Our endeavour is to excel in education and improve, elevate, develop and deliver programmes and courses, which transcend the expectations and requirements of students.
3. We continually upgrade the knowledge and skills of all our employees through a planned development of staff for content updating and training in professional skills using Industries.

DEPARTMENT VISION:

To become a center for quality education in the field of computer science & engineering and to create competent professionals.

DEPARTMENT MISSION:

1. To provide academic ambience and latest software tools to prepare competent Software Engineers with strong theoretical and practical knowledge.
2. To foster professionalism and strong work ethics in students for the betterment of society.
3. To uplift innovative research in Computer Science and Engineering to serve the needs of Industry, Government and Society.
4. To encourage the spirit of entrepreneurship and adaptability in our students in view of the everchanging scenario of the Software Industry

ABSTRACT

Water pollution is a problem of serious environmental issue in India as its 70 percent surface and groundwater resources contaminated by various pollutants such as biological, toxic, organic, and inorganic. Among all, the largest source of water pollution in India is untreated sewage. Agricultural runoff and unregulated small-scale industry are the other sources of pollution. Most of the rivers, lakes and surface water in our country are polluted due to industries, untreated sewage and solid wastes. The outcome of this mammoth problem is the rising socio-economic cost of poor water quality. Almost 40 million liters of wastewater enters rivers and other water bodies every day with a very small fraction of it being adequately treated. The most badly hit class due to water pollution is the weaker sections of the society as these people mostly resides near main water bodies in India. According to the World Bank report such releases of pollution in the up streams reduces the economic growth in the downstream areas, which reduces the growth of GDP in these regions which create downward impact on the overall GDP of the country. Almost half of the GDP is lost. Due to the polluted stretches in India the agricultural revenues decreases to 9% and also a 16% fall in agricultural yields downstream areas. Some remedial measures should be adopted to protect the poor masses of the country. Water pollution near oceans, rivers, lakes should be controlled. Waste ingredients should not be disposed in oceans, rivers, lakes and ground water. Controlled use of pesticides and fertilizers should be done as this will prevent runoffs of the material into nearby water sources. Clean water bodies will result in the sustained development of the country particularly the vulnerable sections of the society. It is the dire need of the hour to control water pollution to achieve 'the vision of the 'healthy nation'.

1.EXECUTIVE SUMMARY

1.1BRIEF INFORMATION OF THE COMMUNITY:

INTRODUCTION:

Water pollution refers to the contamination of water bodies such as rivers, lakes, oceans, and groundwater by harmful substances, making the water unsafe for drinking, agriculture, industry, or aquatic life. This contamination can result from human activities like dumping industrial waste, agricultural runoff, sewage discharge, and oil spills, as well as from natural causes such as volcanic eruptions or storms. When pollutants enter the water, they disrupt its natural balance, harm living organisms, and reduce water quality. Common pollutants include chemicals, plastics, heavy metals, and microorganisms. Water pollution poses serious threats to human health, leading to diseases like cholera, dysentery, and hepatitis. It also damages ecosystems, killing fish and other aquatic species, and can harm economic activities like fishing and tourism.

DEFINITION AS PER USDA: The USDA generally defines water pollution as any alteration to the physical, chemical, or biological properties of water that negatively impacts its quality and makes it harmful or unsuitable for its intended uses. This includes the presence of harmful substances or energy forms that degrade water quality and potentially harm humans, animals, or the environment.

DIFFERENT SOURCES OF WATER POLLUTION: Water pollution can be caused due to natural phenomenon or man-made activities. When water comes in contact with anthropogenic factors, it becomes unsuitable for human use and also becomes harmful for other aquatic animals. The causes of water pollution include organic as well as inorganic factors. Elevated temperatures can also lead to water pollution, which can kill fish and alter food chain composition, reduce species biodiversity, and foster invasion by new thermophilic species.

1.2 OBJECTIVES OF THE STUDY :

- **Identify Sources of Pollution**

To investigate the major causes of water pollution, including agricultural runoff, industrial discharges, and domestic waste.

- **Assess Water Quality**

To test and analyze physical, chemical, and biological parameters of local water sources.

- **Evaluate Impact on Public Health**

To study the relationship between polluted water and the occurrence of waterborne diseases in the community.

- **Analyze Socio-Economic Effects**

To examine how water pollution affects livelihoods, agriculture, and economic activities.

- **Assess Community Awareness and Practices**

To understand the level of knowledge, attitudes, and habits of local residents regarding safe water use and pollution prevention.

- **Identify Gaps in Infrastructure and Policy**

To review the effectiveness of existing water management systems, waste disposal facilities, and regulatory measures.

- **Recommend Preventive and Remedial Measures**

To suggest practical, low-cost, and sustainable solutions for reducing water pollution and improving water quality.

EFFECTS OF WATER POLLUTION

ON HUMAN HEALTH

Human contact with polluted water through drinking, skin contact or even consumption of food that is grown or prepared using polluted water poses a significant danger to health. Pollutants in water may directly cause disease or act as poisons.

HEPATITIS

1.3 SUMMARY OF ACTIVITIES DONE DURING THE PROJECT:

As part of the water pollution awareness and prevention project in Enakandla village, several activities were carried out to educate and engage the local community. We conducted surveys to understand the sources and impact of water pollution in the area, including contamination from agricultural runoff and improper waste disposal. Awareness programs were organized through group meetings, poster displays, and street plays to highlight the importance of clean water and safe sanitation practices. Practical demonstrations were given on water purification methods like boiling, filtering, and chlorination. We collaborated with village leaders to promote waste segregation and proper drainage maintenance to prevent pollution of local water bodies. In addition, school-level sessions were held to teach children about the health hazards of polluted water and ways to protect water resources. Overall, the project aimed to build long-term community responsibility towards maintaining clean and safe water in Enakandla village.

1.4 LEARNING OBJECTIVES & OUTCOMES :

Learning Objectives :

- To understand the causes and effects of water pollution in rural communities.
- To develop communication skills by interacting with villagers and stakeholders.
- To learn practical methods for water conservation and purification.
- To create awareness materials and conduct educational activities.
- To gain experience in planning, organizing, and executing a community service project.

Learning Outcomes :

- Gained knowledge of local water pollution sources and preventive measures.
- Improved teamwork, leadership, and public speaking skills through community engagement.
- Successfully raised awareness among villagers about safe water practices and pollution control.
- Learned to design and deliver impactful awareness programs using posters, demonstrations, and discussions.
- Developed a sense of social responsibility and commitment to environmental protection.

2. OVERVIEW OF THE COMMUNITY

2.1 WATER POLLUTION PROFILE OF THE COMMUNITY:

Enakandla is a Village, Town and Mandal Headquater in Banaganapalle Mandal in Nandyal District of Andhra Pradesh State, India. Enakandla is the village of Banaganapalle Mandal. It belongs to Andhra region. It is located 35 KM towards South from District. The surrounding nearby villages and it's are husainpuram. The latitude 15.35956 and longitude 78.20845 are the geocoordinate of the Enakandla. The people their celebrate almost all the festivals. They follow their ancestral traditions. The pin code of Banaganapalle is 518124.

2.2 WATER POLLUTION AWARENESS OF PEOPLE IN THE COMMUNITY:

On the first day of our survey to raise awareness about water pollution and its harmful effects, we began by gaining a detailed understanding of the village. We studied the localities, population, literacy rate, and primary sources of income of the villagers. We also observed the sources of water in the village, their usage, and possible causes of contamination .Through this community service project, we developed valuable skills in communicating with the villagers and local officials. After obtaining a clear overview of the village, we focused on identifying water-related problems such as pollution sources, scarcity, and sanitation issues. We documented these findings carefully to address them effectively in the next stages of our project.

2.3 SOCIO- ECONOMIC CONDITIONS OF THE COMMUNITY:

The primary source of income for the villagers is agriculture, with farming on agricultural lands being the main livelihood. However, water pollution has begun to affect crop yields and soil quality, posing a threat to agricultural productivity. Many villagers also work as daily wage laborers in nearby cities, but health issues caused by polluted water, such as waterborne diseases, often reduce their ability to work regularly.

3. COMMUNITY SERVICE PART

3.1 SURVEY ON WATER POLLUTION AWARENESS

- ❖ As part of the community service project, we visited the village to study its geographical features and understand the living conditions of its residents. We interacted with villagers to learn about their lifestyles, habitations, and the major problems they face.
- ❖ We observed that many villagers lack awareness about water pollution and its harmful effects on health, agriculture, and livestock. Contamination from agricultural runoff, domestic waste, and chemical usage emerged as a key concern.
- ❖ After discussing these findings with our project guide, we decided to focus on addressing the issue of water pollution and its impact on the community.
- ❖ We began our survey by interviewing a couple of houses per street to gather detailed information about their daily water usage, sources of water, and any health or agricultural problems caused by polluted water.

Fig 3.1: Water Pollution in Village Canals

3.2 SKILLS ACQUIRED BY STUDENTS' ACTIVITY:

- ❖ We learned that water pollution is not only an environmental issue but also a socio-economic problem that affects livelihoods, health, and daily life in the village.
- ❖ Many villagers were unaware that untreated wastewater and chemical runoff from fields were major causes of contamination in canals and ponds.
- ❖ We identified the need to educate residents about safe water practices, proper waste disposal, and methods to reduce chemical contamination.
- ❖ After understanding the complete situation in the village, we conducted an awareness program highlighting the importance of clean water, the dangers of polluted water, and simple preventive measures the community could adopt.
- ❖ We also visited several households to personally discuss these issues, ensuring that the message reached even those who could not attend the program.

5. OUTCOMES DESCRIPTION

5.1 AWARENESS PROGRAM ABOUT WATER POLLUTION:

We began our door-to-door survey in the village by preparing a set of questionnaires to better understand the villagers' problems related to water quality. With the help of the *grama* volunteer, we were able to interact with residents more effectively. This greatly improved our survey process.

We divided our work over a six-week period. By visiting each household, we gained a deeper understanding of the community's issues. The villagers responded positively, sharing their experiences and challenges openly. We were also able to learn about the rich traditions and cultural practices in the village while identifying modern solutions to address water-related problems.

During our interviews, we found that many residents were experiencing health issues—such as stomach infections, skin diseases, and fever—caused by consuming or using polluted water. Our socio-economic survey revealed that access to clean water was limited in some areas, and many households relied on canal water for irrigation and domestic purposes.

Fig 5.1: Effects of Water Pollution on Village Canals

5.2 WATER POLLUTION AWARENESS AND DETAILS:

We started by creating basic awareness about the causes and effects of water pollution. We explained how agricultural runoff, improper waste disposal, and excessive use of chemicals in farming contribute to water contamination.

Many villagers were unaware of the direct link between polluted water and diseases such as diarrhea, typhoid, and skin infections. We also discussed how contaminated water affects crops, reduces soil fertility, and harms livestock health.

We encouraged the use of natural farming methods, safe waste disposal practices, and water filtration techniques for domestic use. We also suggested practical solutions such as:

1. **Proper waste management** to avoid dumping waste into canals and ponds.
2. **Reducing chemical fertilizer and pesticide usage** to minimize agricultural runoff.
3. **Rainwater harvesting** to improve the availability of clean water.
4. **Community clean-up drives** to maintain hygiene around water sources.

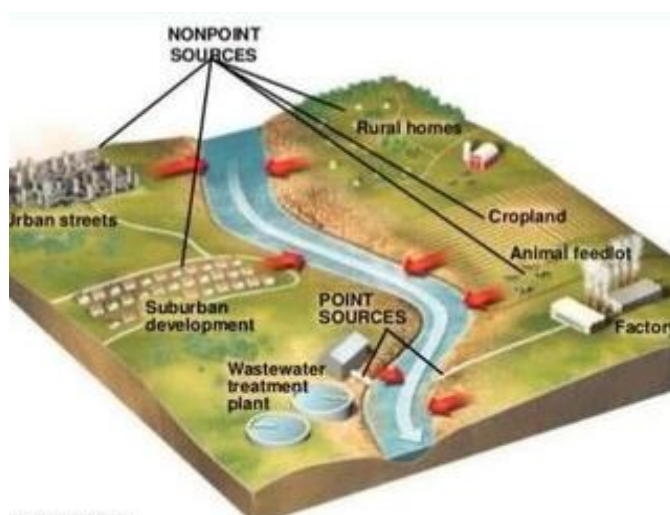

Fig 5.2: Sources and Pathways of Water Pollution in the Village

5.3 PROBLEMS IDENTIFIED DURING PROJECT

On our first day, we studied the geographical layout, literacy rate (56%), and primary sources of income in the village. Our survey revealed the following main problems related to water pollution:

- Lack of awareness about the harmful effects of polluted water.
- Health issues such as waterborne diseases caused by contaminated water.
- Dependency on polluted canal water for both domestic and agricultural purposes.
- Increased agricultural costs due to reduced productivity from polluted irrigation water.

WATER POLLUTION

- Lack of proper waste management and sewage systems.

Fig 5.3 Impact of Polluted Irrigation Water on Crops

5.4 SURVEY OUTCOMES:

From our interactions, we found that adopting clean water practices offers multiple benefits:

- Reduction in waterborne diseases.
- Improvement in agricultural yields by using clean irrigation water.
- Protection of soil fertility by reducing chemical runoff.
- Preservation of aquatic life in canals and ponds.
- Promotion of sustainable and eco-friendly farming methods.
- Reduced household expenses on medical treatment.

6 . CONCLUSION

we understood that it is the contamination of rivers, lakes, ponds, and other water bodies with harmful substances, often caused by human activities such as dumping industrial waste, releasing untreated sewage, agricultural runoff with fertilizers and pesticides, and oil spills. We learned that pollutants may be chemical, physical, or biological, and they seriously affect aquatic plants and animals, disturb the balance of ecosystems, and cause dangerous health problems like cholera, dysentery, and hepatitis. Water pollution also impacts livelihoods by reducing fish populations, damaging agriculture, and affecting tourism. During our activity in Enakandla village, we observed local sources of pollution, interacted with villagers to understand the issues they face, and discussed simple solutions such as proper waste disposal, avoiding chemical overuse, and protecting water sources. This experience taught us the importance of community participation, strict pollution control measures, and sustainable practices to ensure clean and safe water for the present and future generations.

This project made us realize that solving water pollution requires both community effort and strict enforcement of environmental laws. By working together and adopting sustainable practices, we can protect our water resources and ensure a healthier, cleaner future for the people of Enakandla and beyond.
